

Here are two videos about what a QR code is:

[Video 1](#)

[Video 2](#)

You can use this QR code on business cards, flyers, T-Shirts, mugs... or on anything you can think of, in order to promote your business. You can also put it on your website, it can be scanned through the computer monitor, too.

Your app will be easily reachable for everyone with just a quick scan. So you will be much easier to reach by being available on more fronts - in some virtual environments as well as physical ones.

Once people install the app, you will always be in your clients' pockets.

The app updates automatically with the website, so there will be no need for further manual modifications.

I hope this helps.
